

## Air Quality

The Academy is a synthetic minor source of criteria pollutants, an area source of hazardous air pollutants (HAPs), and a minor source of greenhouse gasses (GHG). There are two permitted sources at the Academy—four industrial boilers at the central heat plant, and gasoline storage/transfer at multiple locations. Other less significant emission sources include emergency generators, boilers and water heaters, abrasive cleaning, solvent cleaning, Fire Department training, jet engine testing, munitions, surface coating, woodworking, miscellaneous chemical usage, airfield operations, grounds keeping, heavy equipment, and motor vehicles. The Academy is located in an attainment maintenance area for carbon monoxide, and conformity with the State Implementation Plan (SIP) is evaluated for all projects that take place within its borders.
